

Notes 4

How to install and remove software using the APT command.

Step 1 is update debian. `sudo apt update; sudo apt upgrade -y`

Step 2 to install `sudo apt install package_name`

Step 3 uninstall `sudo apt remove python3`

Example from slides:

- `sudo apt install firefox flameshot caffeine -y`
- Installs several programs in one command.
- `sudo apt remove firefox flameshot caffeine -y`
- Removes several programs in one command.
- `sudo apt purge firefox+ flameshot- caffeine- vlc+`
- Removes programs and all remaining traces.

How to create a shell script.

Step 1 Create the file

Create a file in the text editor and save it. Save the file as file_name.txt

Step 2 Add shell declaration

Add the shell interpreter `#!/bin/bash`

Step 3 Add your code

Put in the code. Example: `echo "Testing testing 123"`

Step 4 Run the script

Run the program in tilix by typing `bash ~/scripts/New\ Document.txt`
